EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Berthold on 3-9-2005.

The application has been amended as follows:

Replace claim 1 with:

1. (Currently Amended) A method for adjusting a static torque on a slider in a head-suspension assembly comprising:

measuring a static attitude component of the slider;

determining the attitude component torsional stiffness of the head-suspension assembly by determining the attitude component effective moment-of-inertia of the slider;

calculating, from the measured static attitude component and the determined torsional stiffness, the adjustment of the static attitude component required to achieve the desired static torque; and

adjusting the static attitude component.

Cancel claim 2.

2. (Cancelled)

Replace claim 3 with:

3. (Currently Amended) The method of claim 1 wherein determining the moment-of-inertia comprises calculating the moment-of-inertia from the known geometry and material composition of the head-suspension assembly.

Allowable Subject Matter

Claims 1 and 3-26 allowed.

The following is an examiner's statement of reasons for allowance:

The independent claim 1 recites "calculating, from the measured static attitude component and the determined torsional stiffness, the adjustment of the static attitude component required to achieve the desired static torque". This feature in combination with the remaining claimed structure avoids the prior art of record.

The independent claim 15 recites "determining the pitch torsional stiffness of the head-suspension assembly by determining the effective moment-of-inertia of the slider about the pitch axis and measuring the pitch natural frequency of the slider". This feature in combination with the remaining claimed structure avoids the prior art of record.

The independent claim 23 recites "determining the roll torsional stiffness of the head-suspension assembly by determining the effective moment-of-inertia of the slider

Art Unit: 2863

about the roll axis and measuring the roll natural frequency of the slider". This feature in combination with the remaining claimed structure avoids the prior art of record.

U.S. Patent 5,473,488 to Gustafson does not disclose adjusting attitude using a moment of inertia.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
